

I have \$50. A movie ticket costs \$10, snacks \$5, and I want to go with 3 friends. Use chain of thought to see if I can afford it.

Let's solve this with **Chain of Thought reasoning** step by step:

Step-by-Step Breakdown

1. **Budget:** You have **\$50**.
2. **Movie ticket cost:** \$10 each.
 - You + 3 friends = 4 tickets.
 - $4 \times 10 = 40$.
 - Ticket total = **\$40**.
3. **Snack cost:** \$5 each.
 - Again, 4 people.
 - $4 \times 5 = 20$.
 - Snack total = **\$20**.
4. **Total cost:** Tickets (\$40) + Snacks (\$20).
 - $40 + 20 = 60$.
 - Total = **\$60**.
5. **Compare with budget:** You only have \$50.
 - Shortfall = $60 - 50 = 10$.
 - You're **\$10 short**.

Final Answer

 Using chain of thought: You **cannot afford** tickets + snacks for yourself and 3 friends with \$50. You'd need **\$10 more**.

Options to make it work:

- Skip snacks → \$40 total, within budget.
- Ask each friend to pay for their own ticket/snacks.
- Buy fewer snacks or share.
